

Water Lights

2006

Electronic and Lighting installation
9 feet x 6 feet x 9 feet (HxWxD)

One rainy day, while watching the water flowing endlessly down the window, I thought how interesting it would be to express the movement and the shape of the water flowing past with light. The result is this interactive installation. When viewers approach the work, water flows over light-emitting diodes (LEDs), and the lights come on when the water touches an LED. The intensity of the LEDs is regulated by the quantity of water running over them.

This work is the second *Water Lights* that was developed with the original idea from *Water Lights 2004*. I put the clear acrylic sheet in front of the surface to be covered with water drops. In addition, the frame was made like a window to allow people to bring my piece to their own experience in rainy day with it.
